

Planning

- Strategy
 - Mort = Seinfeld
 - Observational comedy maps well
 - Automate the annotation and schema evolution
 - Sort of recursive because you have to update everything before once the schema changes
 - Manually audit the annotation quality
 - Add performance notes that are only apparent visually/auditorily
 - Have it create prompts to take the annotation and generate them (with performance notes)
 - Compare them to the funniness of the original to gauge generative sufficiency
 - Once I have generative sufficiency then work about concept expansion
 - Re-evaluate the same way as with generative sufficiency, but with blind comparisons between generated and real jokes
 - I think the big things I have to add eventually
 - Long-term planning and callbacks across multiple jokes
 - Breaking the rules: jokes can't seem formulaic, or at the very least formula breakers should be a big part of the mold
 - And breaker breakers and breaker breaker breakers, etc.
 - The formula can be the basis for a joke; then you do tweaks and alterations in structure and presentation to keep the audience on their toes
 - Example from an observation on my own jokes:
<https://gemini.google.com/share/0187fb80a315>
 - And another joke generation/generalization:
<https://gemini.google.com/share/8cfd68d23fb5>
- Technical areas
 - Comparisons
 - Look at contemporary/SOTA humor engines and see if they could be integrated somehow to address weaknesses
 - If there are specific areas (like relatable insight generation) that LLMs struggle on when testing generative sufficiency (i.e., it's the model not the data), think about tuning an open-source model or SLM initially
 - For instance, Seinfeld used a bunch of great neologisms, which I sort of doubt an LLM could match the quality of consistently
 - Gemini actually make decent standup (given good material) via:
<https://gemini.google.com/share/e49a04253b53>
 - Consider using data mining techniques on the annotated jokes to find patterns
 - Also consider deep reinforcement learning, but first consider if this meets the criterion laid out in 490 like the Markov property (doubtful)

- Use a similar tech stack coding style to my team at Toast to ensure that I'm getting the most out of the project
- Long-term strategy
 - If the game works, pivot to the other ideas that need more traction (like business comedy API)
 - Use virality via Chatbase [LinkedIn posts](#)/interview

Reference Material

1. Seinfeld book, specials, interviews, etc.
 - a. <https://claude.ai/share/0e5e98d8-b51c-4951-a112-95d766c93adf>
 - i. See latest response for details, lots of other resources also in the early responses
2. Dunkey comment sections
 - a. I swear to god it's all just people making jokes
3. Siivagunner
4. Arrested Development, Curb, Nathan For You, Simpsons, The Office, Parks and Rec, all of the funniest shows
